Integration Git & GitHub Workflow • AI & Python Foundations

PART C — API + DATABASE INTEGRATION

Practice Tasks

1. Swap the in-memory repository for the EF Core one and re-run every endpoint in Swagger — nothing about the URL or request/response shape should change from the outside.

Output:

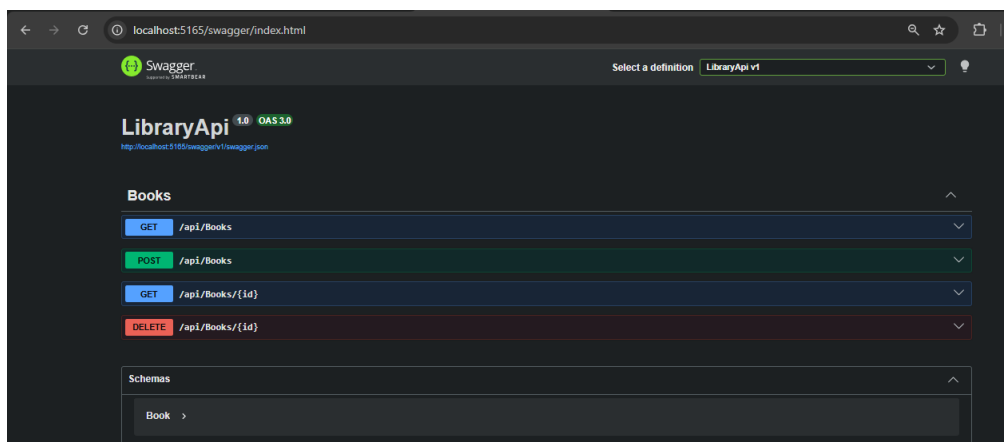

The screenshot shows the Visual Studio IDE with the 'BookRepository.cs' file open. The file contains the following code:

```
8 public async Task<bool> DeleteAsync(int id)
9 {
10     var book = await _context.Books.FindAsync(id);
11     if (book == null)
12         return false;
13     _context.Books.Remove(book);
14     await _context.SaveChangesAsync();
15     return true;
16 }
```

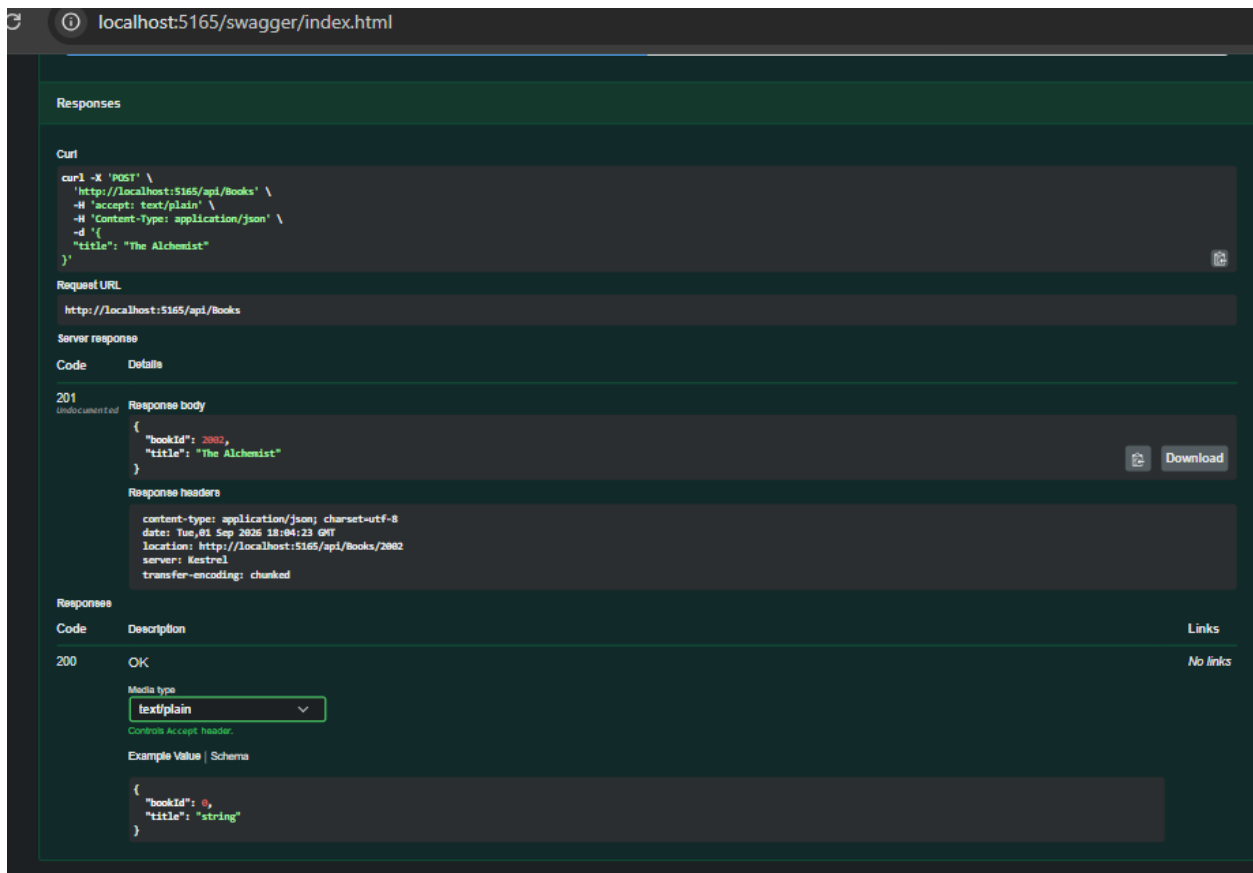

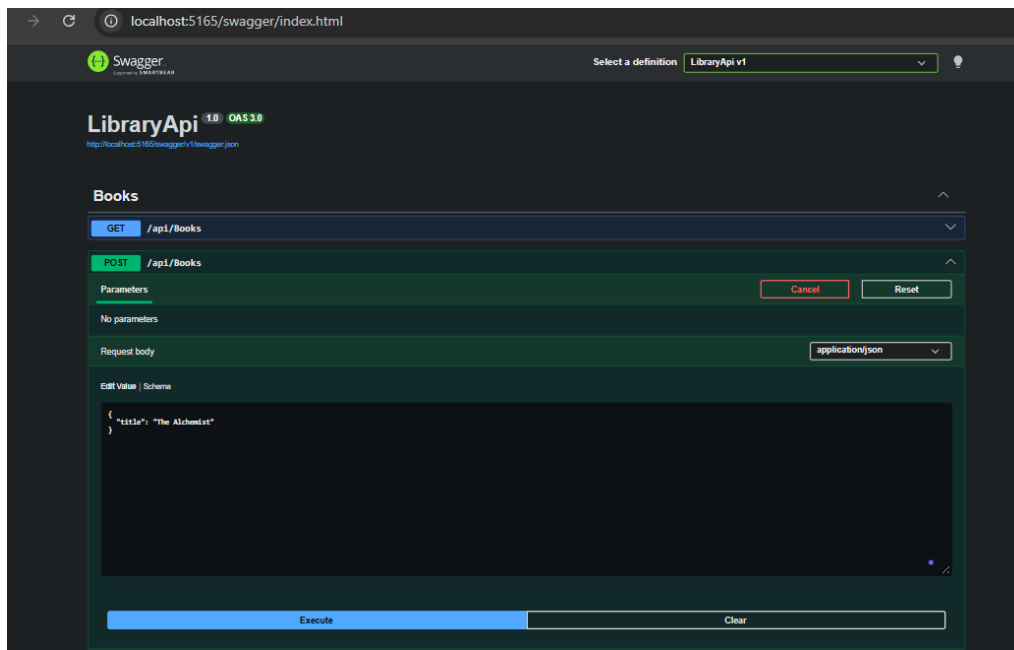

The terminal output shows the following commands and results:

```
PS D:\Internship-Tasks\Week3_EFCore_Practice\LibraryApi> dotnet build
